EXPERIMENT-8

Name: Shasmeen Syed Roll No.: 240701492

Experiment 8: Create storyboards to represent the user flow for your application using Balsamiq

This experiment helps in creating a storyboard to represent the user flow of an application using the Balsamiq wireframing tool. The purpose is to visually map how a user interacts with the application step by step, from the initial screen to the final outcome. In this experiment, multiple screens were designed to show different stages such as selecting a parking location, viewing details, choosing a slot, and confirming the booking. By organizing these screens in a logical sequence, the storyboard clearly demonstrates the navigation and interaction within the application.

Frame 1 : Login Screen

This is the app's welcome/login interface.
At the top, the brand name *FOODIE* sits centered on a warm brown header bar, giving a clean and inviting first impression.
Below that, on a white card-like section, the user sees a **LOGIN** title followed by two neatly styled input fields: **Username & Password.** The layout is minimal and uncluttered, making it easy for users to quickly sign in.

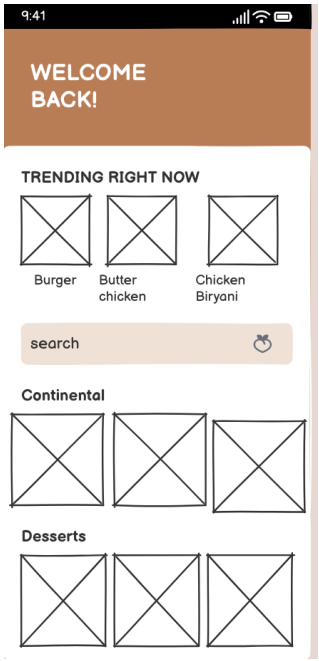
Frame 2 : Home Screen

This screen appears after the user logs in.
It begins with a warm-toned header that cheerfully greets the user with **WELCOME BACK!**

Below that, the content sits on a white background panel containing:

- A **Trending Right Now** section with three food categories displayed in square thumbnails (Burger, Butter Chicken, Chicken Biryani).
- A **search bar** allowing users to look up items.
- Two more categories: **Continental** and **Desserts**, each represented with image placeholders arranged in a grid format.

The layout feels lively, easy to browse, and designed to encourage quick discovery.



Frame 3 : Product Details Screen

This is the detailed view of a selected food item.

At the top is a large image placeholder showing the dish.
Below it, the product name appears in bold:

DOUBLE WHOPPER CHICKEN BURGER

Then the pricing and rating section shows:

- Price
- Star rating
- “99+ people loved this” text for social validation

There's an **Add to Cart** button styled clearly so the user can act immediately.

Finally, a **Description** section explains the dish with an appealing, food-rich narrative describing ingredients, flavors, and what the meal includes.

Frame 4 : Checkout Screen

This screen summarizes the item added to the cart and collects delivery information.

At the top is a compact **order summary card**, showing:

- Item name
- Quantity
- Price
- A small thumbnail of the product

Next is the **Select Delivery Location** section with an input box labeled *Enter Address*.

Further down is the **Payment** details panel listing:

- Item price
- Delivery charge
- GST
- Total amount

The total is highlighted clearly so the user knows what they'll pay.

At the bottom, a large **PROCEED** button encourages the user to move to the payment or confirmation step.
